A bird's-eye view of what we are building, why, and how.

What is FX-Teller?

FX-Teller is a live podcast-style trading community built for forex traders in Kerala, India. A single host streams live audio commentary on market sessions and pushes real-time trade calls to listeners — with instant alerts, sentiment-driven music cues, and a simple subscription model.

Phase 1 Strategy: Web-First

Rather than building a native mobile app (which requires App Store approval, platform-specific development, and weeks of testing), Phase 1 launches as a **browser-based web application**. This approach:

- Gets the product to market in **4 weeks** vs. 8–12 weeks for mobile
- Works instantly on any device — phone, tablet, laptop — no install required
- Lets us **validate with real users** before investing further
- Reuses the existing Host Console and NestJS backend already built

Why This Approach Wins

Every day we are not live is a day we are not learning. A web-first Phase 1 means we can sign up real traders, collect feedback, and prove the model — all before committing to native mobile app development in Phase 2. The mobile app will share the same backend, so no work is wasted.

CORE VALUE PROPOSITION

Live Audio

Real-time commentary via 100ms.live. Listen through your browser — no downloads, no apps.

Instant Calls

Trade calls arrive in under a second with a browser notification. Pair, direction, entry, SL, TP — all on screen.

Sentiment Cues

Background music switches between Calm and Alert. You feel the market before you read it.

Exactly what Phase 1 includes — and what it does not.

1. Listener Web App BUILD

A browser-based interface where traders join live sessions, hear audio commentary, and receive trade calls.

- Phone OTP authentication — no password needed
- Live audio room via 100ms embedded player
- Real-time trade call cards with pair, direction, entry, SL, TP

- Browser push notifications for incoming trade calls
- Session schedule with upcoming trading sessions
- Trial countdown banner for the 3-day free trial

- Razorpay checkout for subscription (pricing to be decided)
- Music sentiment indicator — Calm / Alert state
- User profile with name, phone, and subscription status

- Responsive, mobile-first design that works on all screen sizes
- PWA basics for "Add to Home Screen" on supported browsers
- Auto-reconnect on network drop

2. Host Console BUILT

The host's web dashboard for running live sessions. Already built — minor polish and deployment.

- Start and stop live sessions
- Push trade calls with instrument, side, entry, SL, TP

- Switch music sentiment between Calm and Alert
- View recent trade call history

3. Backend API COMPLETE & DEPLOY

NestJS backend powering all application modules. Already scaffolded; needs completion and deployment.

Auth & Users

- Phone OTP request and verification
- JWT session management
- User profile and role management

Sessions & 100ms

- Create and manage live sessions
- 100ms token minting for host and listener roles
- SSE event broadcast bus for real-time updates

Trade Calls & Music

- Push trade calls with real-time broadcast
- Music sentiment state switching
- Recent calls history API

Subscriptions

- Razorpay subscription creation
- Webhook verification handler
- Trial state management

Deferred to Phase 2+ (Out of Scope)

- Native mobile apps (iOS / Android)
- In-app chat between listeners and host
- Multi-host marketplace
- Advanced analytics dashboard
- Referral program
- Yearly subscription plans

Deliverables & Timeline

What you will receive from this engagement and the delivery schedule.

Deliverables

Browser-Based Web App (Beta)

Listener web interface + host console, deployed and accessible via your domain. First-month delivery is a fully usable beta.

Backend API

Complete NestJS API with all modules deployed on the production VPS.

Database & Infrastructure

PostgreSQL 16 with schema, migrations, SSL, firewall, and daily backups.

Documentation

Setup guide, admin instructions, and API endpoint reference.

Post-Launch Support

2 weeks of bug fixes and minor adjustments after the launch date.

Handover

Source code access, admin credentials, and a handover call to walk through everything.

Timeline · 4 Weeks

WEEK 1

Backend Completion & Infrastructure

Complete and test all backend modules. Set up the production VPS with Docker, PostgreSQL, SWAG reverse proxy, and SSL certificates. Deploy backend to staging.

WEEK 2

Listener Web App Development

Build the browser-based listener interface: authentication flow, 100ms audio integration, trade call cards, session schedule, trial banner, and Razorpay checkout. Connect to backend APIs.

WEEK 3

Integration, Polish & Testing

End-to-end testing of the full user flow. Browser notification setup, responsive design QA, edge case handling, and performance optimisation.

WEEK 4

Deployment, UAT & Launch

Production deployment, domain and DNS configuration. User acceptance testing with you and initial traders. Documentation handover and launch.

04 Pricing & Payment Terms

A transparent breakdown of development costs and ongoing expenses.

Development Cost

Phase 1 Web Application Development	₹65,000
Advance payment (50% — due on project start)	₹32,500
Balance payment (50% — due on delivery)	₹32,500
Total development cost	₹65,000

The development cost is a fixed, one-time fee. No hidden charges, no scope creep. Any changes outside the agreed scope will be discussed and quoted separately.

ONGOING COSTS (BILLED AS ACTUALS)

ITEM	NOTES
VPS Hosting (OVH)	2 vCPU, 4 GB RAM, 80 GB SSD — billed as actual
Domain Name	.app or .in domain — billed as actual
100ms.live (Audio Streaming)	Free tier included up to 10,000 min/month; paid beyond — billed as actual
Razorpay (Payment Gateway)	Standard processing fee — billed as actual
SMS Provider (OTP Delivery)	Pay-as-you-go — billed as actual

All ongoing costs are billed at actual with no markup. You may choose to procure any of these services directly if you prefer.

PAYMENT TERMS

Step 1 ₹32,500 advance payment required to begin development	Step 2 ₹32,500 balance due on successful delivery of Phase 1	Ongoing Infrastructure costs invoiced monthly at actual with receipts
---	---	--

Assumptions & Next Steps

What we assume from your side, and how we move forward together.

Responsibilities

Client (Kiranchand)

- Provide necessary account credentials (100ms.live, Razorpay, SMS, domain, etc.)
- Provide content: trade calls, session schedule, brand assets

Developer (Axivence)

- Build and deploy the complete web application
- Set up VPS, database, and all infrastructure
- Configure SSL, DNS, and server security
- Provide full documentation and handover
- 2 weeks of post-launch bug fix support

FUTURE PHASES

PHASE	SCOPE	WHEN
PHASE 1	Web app: listener interface + host console + backend	Now (4 weeks)
PHASE 2	Native mobile apps (iOS + Android), in-app chat, reactions, referral system	After Phase 1 validation
PHASE 3	Multi-host marketplace, yearly plans, analytics dashboard, public API	After Phase 2

NEXT STEPS

1

Review and sign this proposal

2

Pay the 50% advance (₹32,500)

3

1-hour kickoff meeting to finalise details

4

Development begins — Week 1 of 4

We look forward to bringing FX-Teller to life.
